

Trench Shields

Excavation work comes with real risks, and NZ legislation is clear about the responsibilities on site. When any excavation face is more than 1.5 metres high, employers must ensure that the face is shored, supported, or otherwise made safe. That requirement exists for one reason, to protect workers from preventable harm.

Trench shields provide a practical, compliant way to meet these obligations. Designed to stabilise excavation faces and reduce the risk of collapse, they create a safer working environment for crews operating below ground level. Whether you're managing small service trenches or larger civil works, trench shields help you meet your legal duties while keeping your team protected.

Built for New Zealand conditions and aligned with current regulations, our trench safety solutions support contractors who want to do the job right, safely, efficiently, and compliantly.

Features

Certified

Various lengths, widths & heights

Manhole boxes available

Bespoke & custom builds available
