

Curtain sider

When a long standing client in the directional drilling industry needed a smarter solution for load capability and operational efficiency, they came to TruGroup, entrusting us to deliver where others had failed before.

Box body configurations had presented consistent challenges, restricted movement, limited airflow, and inadequate space for the additives and products central to their operation. A curtain sider configuration solved all three, offering unrestricted access across the full length of the vehicle, improved ventilation, and a layout the client could configure to their own operational workflow.

A standard industry build, executed to a higher standard. That's what TruGroup was asked to deliver, and did.
